LASER HAIR REMOVAL

Information

Laser hair removal is the process of hair removal by means of exposure to pulses of light laser that destroys the hair follicles.

There are two types of melanin in the hair eumelanin gives hair brown or black colour, while pheomelanin gives hair blonde or red colour. Due to the selective absorption of photons of laser light only hair with colours such as; black, brown, reddish brown or dirty brown can be removed. Laser works best with dark coarse hair.
